(without alignments) 328 208 Million cell updates/sec

US 09 603 665 5\_COPY\_1950\_2144 Perfect score.

1 LETTERAGHLVKPEADTLXQV... Sequence

Gapop 60.0 , Gapext 60.0 Scoring table:

283138 seqs, 96089334 residues Searched:

Word size :

931 Total number of hits satisfying chosen parameters:

Minimum DH seq length: 0 Maximum DH seq length: 2000000000

Post-processing: Listing first 45 summaries

pir1:\* pir2:\* pir3:\* pir4:\* PIR\_71:\* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure dense expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                 Human bone marrow expressed probe encoded protein SEQ 1D NO; 30133.

                                                            fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at Itp.wipo.int/pub/published_pct_sequences.
         The invention relates to a single exon nucleic acid probe for measuring human que expression in a sample derived from human locatal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying quee expression in samples derived from human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Single exon nucleic acid probes for analyzing gene expression in human

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gone expression in brain cell samples, which may enable the diagnosis and improved treatment of network system diseases such as Alzheimer's disease, multiple seletosis, schilophronia, epileps, and cancers. The present sequence is a protein encoded by one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human brain expressed single exon probe encoded protein SEG ID NG: 29537.
Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at Itp.wipo.inL/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Single exon nucleic acid probes for analyzing gene expression in human

The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart (see ARAZ1535-ARA41805). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying quene expression is samples derived from the human heart via mirrowarrays By measuring gene expression, the probes are useful for predicting, diagnosing, stading, stading, managing and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease.

The invention relates to a spatially-addressable set of sinule exon nucleic acid probes for measuring quee expression in a sample derived from human breast and HT 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for genemic DNA predicted to encode proteins. They are useful for genemic by a force of the microarray of this invention predicting of chemical agents on cells, the microarray of this invention presents a far greater diversity of probes for measuring quee expression, with far less bias
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    present sequence is a peptide encoded by a single exon neglect acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIFO at ttp.Wipo.int/pub/lished_pet_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                      than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The

the present invention relates to single exon nucleic acid probes (SENP) see AA131315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples delived from human placents. The probes are useful for antenatal diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; cytokine; cell proliferation; cell differentiation; gene therapy,

The invention relates to human polymorteotides (AAI79941-AAI93841) and the encoded proteins (AAU00010-AAU13910) that exhibit activity elating to eytoxine, cell proliferation of cell differentiation or which may induce
                                                                                                                                                                                                                                                production of other cytokines in other cell pupulations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis requialing activity, issue growth factor activity, immunomedulatory activity and activity and may be useful in the diagnosis and/or transment of carrows.
                                                                                                                                                                                                                                                                                                                                                                                                                             Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_scquences.
                                                                                                                                                                                                                                                                                                                                                                                          treatment of cancer, leukaemia, nervous system disorders, arthritis and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention provides a number of sindle exon nucleur acid probes which are derived from genomic sequences expressed in the human bonce marrow. They can be used to measure quene expression in bonc marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, loukachie and mycloma. The present sequence is a protein encoded by one of the probes of the invention.

```
Human; foetai Liver; gene expression; single exon nucleic acid probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver -
                                                                                                                                                                                                                                                                                                            detection of a microbe, using the gyrase gene as the index. The method involves the use of PCR primers to amplify DNA from the microbe, which is then identified or detected depending on its base sequence. The method can be used to classify and identified an unidentified microbe strain rapidly and with high precision. The present sequence represents a gyrase protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Peptide #7963 encoded by human foetal liver single exon probe.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
    The sequence is that of a protein which can be used in the preparation of the recombinant breast cancer antiqen, BRCA1, binding preparation of the recombinant breast cancer antiqen, BRCA1, binding proteins BARD1, B123, BE14, BE14 or BE445, or a composition for the detection of a BARD1, B123, BE14, BE14 or BE445, or a remposition of a the sequence, specifically a wild type BARD1 composition for the detection of a purification of a BACA1, useful to identify a patient having, or at crisk of developing cancer. BARD1 can be used in the preparation of an anti-BARD1 antibody, and in the detection and purification of a BRCA1 or profein BARD1, B123, BE2, BE14, BE31 or BE445 can used in the preparation of an interpretation of a binding protein agonist or antagonist that alters denoting of BARD1, H123, BE2, BE14, BE31 or BE445 complex. The antibodies can be used to detect BARD1, B123, BE2, BE14, BE31 or BE445, a specific anti-BARD1 antibody can be used to identify a patient having or at risk of developing cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 102 DESVAMADDSLIMKPLINYQILLIKTRDSSPKVRFAALITVLALAEKLKENYTVLLIPESTPFL 161

                                                                                                                                                                           The invention is directed to BAP28 polypeptides, BAP28 polynucleotide sequences and requiatory region located at the 3' and 5' ends of the HAP28 coding region. The BAP28 polypeptides can be expressed by standard recombinant methodology. HAP28 polymericectudes and polypeptides have been found to be over expressed in prostate tameur cells, therefore levels of BAP28 expression and/or activity may be assayed (e.g. by polymerase chain prostate cancer. Antibodies specific for the BAP28 polypeptides are useful as dignostic regents. Bitalletic markers of the BAP28 gene are useful in genetic analysis. The present sequence represents a protein enroyed by a first cDNA sequence of the BAP28 gene consisting of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 FISKFPAXALMMPLVPQLENPLAGEEKFQERVTKHLIPGIAQFSVAMADDSLWKPLNYQI 120

Sequence and an oligonuclectide comprising a sequence complementary to polynucleotide which comprises a 3'-end sequence, where the oligonucleotide which comprises a 3'-end sequence, where the combination of the 5'-end sequence, is elected from those defined in the specification. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or flagnosis of the primers are also useful for the confection and/or the primers allow obtaining of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs castly without any specialised methods. AAH03163 to AAH18628 and AAH18631 to AAH18722 represent human cDNA sequences, and AAH18632 to AAH18632 represent bugges all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                               The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises, (a) an oliqo-dT primer and an oliqonucleotide complementary to the complementary strand of a polynucleotide which comprises one of oliqonucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end
                                                                                                                                                                                                     Primer sets for synthusizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abrormality of the proteins encoded by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 69.
